

AUDIO SYSTEM/CUP ASSEMBLY

ABSTRACT OF THE DISCLOSURE

An audio system/cup assembly includes a cup for holding a beverage; a removable audio system base; and may also include a removable adaptor base for enabling the cup to be placed in a vehicle cup holder. The cup has a threaded opening in the underside of the cup for securing the audio system base or the adaptor base to the cup. The audio system base and the adaptor base each have an upper portion that threads into the threaded opening in the underside of the cup to secure the base to the cup. Preferably, the cup has a handle and the threaded upper portion of the audio system base mates with the threaded interior surface of the threaded opening in the underside of the cup to locate the audio system controls toward and the speaker(s) facing away from a person holding the audio system/cup assembly when the audio system base is fully threaded into the threaded opening in the underside of the cup.
